Why Single-Use?
Numerous studies show that current reprocessing practices are ineffective, with 75% - 86% of "patient ready" handles wiped with a germicidal wipe remaining positive for bacterial contamination,1,2 and 82% of cleaned blades testing positive for protein deposits.3 Laryngoscopes are difficult to clean and decontaminate appropriately, with a reported 20% of washed and sterilised blades testing positive for occult blood, creating a risk of patient to patient cross-contamination.4

BritePro™ Omni is ready to use straight from the sterile pack, eliminating the risk of cross-contamination. In-pack-testing confirms light function without compromising sterility.
